

ER Model Analysis

Project Title

Online Food Delivery Management System

Objective

To identify and explain the relationships among the entities in the database.

Relationships

1. Customer places Order (One-to-Many)
2. Restaurant offers FoodItem (One-to-Many)
3. Order contains OrderDetails (One-to-Many)
4. FoodItem appears in OrderDetails (One-to-Many)
5. Order has Payment (One-to-One)
6. Order has Delivery (One-to-One)
7. DeliveryPartner delivers Delivery (One-to-Many)
8. Customer writes Review (One-to-Many)
9. FoodItem receives Review (One-to-Many)
10. Order and FoodItem have a Many-to-Many relationship through the OrderDetails table.

Relationship Summary

- One Customer can place many Orders.
- One Restaurant can provide many Food Items.
- One Order can contain multiple Food Items.
- One Food Item can be included in many Orders.
- One Order has one Payment.
- One Order has one Delivery.
- One Customer can write many Reviews.
- One Food Item can receive many Reviews.

Conclusion

The ER model defines how different entities interact with each other and forms the basis for creating the Entity Relationship Diagram (ERD).
